Working with YouTube Video in WordPress

Prepared by Ralph Shank

WordPress allows you to quickly embed a YouTube video by pasting the URL for a YouTube video directly into your content area.

1. Locate the YouTube video you would like to embed on your web page.
2. Click on the “Share” button beneath the video.
3. Copy the URL that appears.
4. Paste the URL into the WordPress content area where you would like the video to appear on your web page.
5. The video will appear on your webpage once the page is published/updated. You may also preview the page using the Preview Changes button on the right sidebar, in the Publish box.

Note: In order for the above method to work, the URL should not be hyperlinked in your content area. It should be plain text.
